

Treated seed

How to drill safely

Vital – remember:

Wear appropriate PPE including coverall and gloves. If necessary, use a face mask. Seed treatments are pesticides and should be handled accordingly. Be sure to read seed tags

Prevent accidental emission of dust into the atmosphere during loading and drilling seed

Don't leave treated seed on the soil surface for birds and wildlife to eat

When you drill:

Don't broadcast or autocast treated seed

Don't fill drills on grassy areas as spills are harder to clear up

Don't tip dust into the drill – leave it in the seed bag

Drill to the right depth (4 cm), rate and speed for the seed treatment

Clean up spills immediately; carry a spill kit at all times

Ensure the drill will not drop seed when transported or at headlands

Before you drill:

Use quality, well-cleaned seed treated by a Bayer-approved supplier

Store treated seed securely

Handle bags of seed carefully and take your time loading the drill. Abrasion creates dust; damage may result in spilt seed

Critically assess the prepared seedbed; does it have stony, cloddy or trashy areas that might limit seed coverage and give uneven emergence?

Check that the drill has been maintained and calibrated, and that coulters are set up correctly

After you drill:

Check fields carefully, particularly headlands. Cover any exposed seed with soil

Check contractors' work for good practice

Remove all seed from the drill. Put seed and dust into labelled bags

Don't re-use empty bags that have contained treated seed

Record drilling operations, settings and any problems. Note the seed tag treatment and drilling date
