

THE NEXT STEP FORWARD FOR SILAGE GROWERS

DKC2684 A high output early/maincrop maize for biogas and livestock production

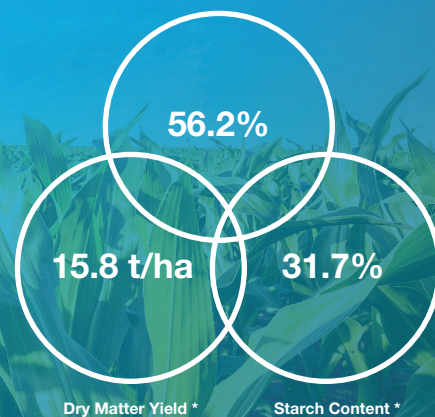

- High DM yields with early/maincrop maturity for maximum output across a range of environments.
- Flint to flint-dent grain for the best combination of fermentable energy and agronomics.
- High starch content and good cell wall digestibility for the highest metabolisable energy yields.
- Good vigour for rapid and reliable establishment regardless of sowing date.
- Good resistance to root and stalk lodging for reliable performance.

Performance in Three Years of Farm Trials

Cell Wall Digestibility *

* Average performance from nine site field-scale trials (2021, 2022 & 2023)

THE #DEKALBDIFFERENCE

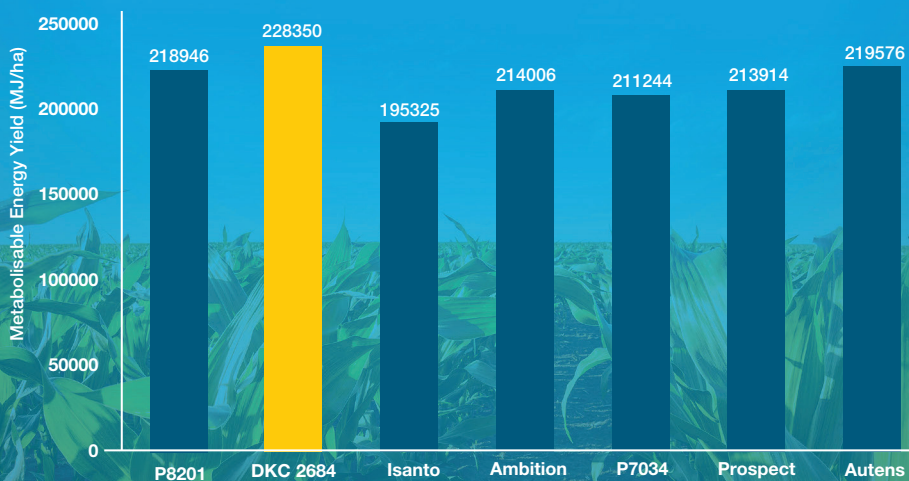

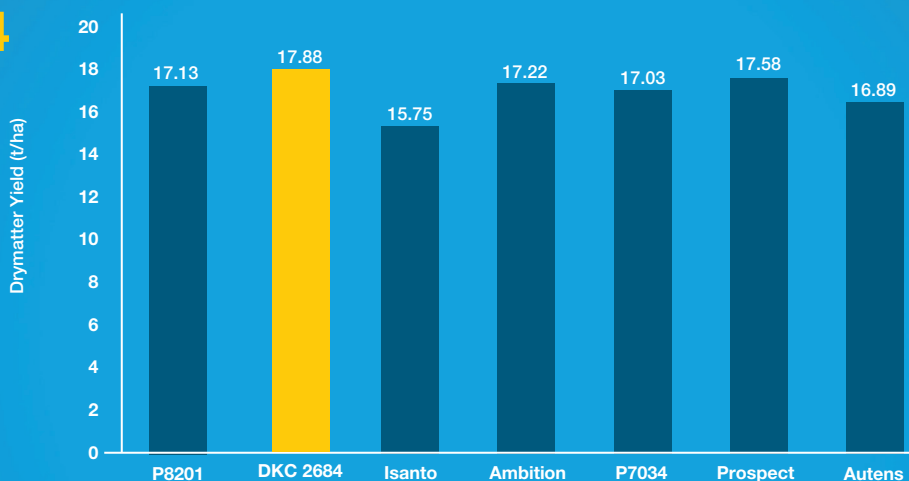

Bringing together the world's foremost genetic resource, advanced analytical technologies and artificial intelligence engine for the most rapid progress in sustainable maize silage production.

A high output early/maincrop maize for biogas and livestock production

Performance in Two Years of NIAB Trials at Less Favourable Sites

DKC2684

Average performance in replicates alongside 2022 & 2023 Forage Maize Descriptive List trials

THE #DEKALBDIFFERENCE

Bringing together the world's foremost genetic resource, advanced analytical technologies and artificial intelligence engine for the most rapid progress in sustainable maize silage production.
